

## **ABSTRACT OF THE DISCLOSURE**

1           A prime mover that stores mechanical energy in case of an electrical failure. When an  
2   electrical failure occurs, the prime mover is activated either automatically by a computer with  
3   a battery back-up or manually. The prime mover oscillates back and forth in a pendulum type  
4   fashion which in turn drives an electrical generator in order to produce electricity. The prime  
5   mover comprises a base, elements that are rotatably mounted to the base, a pick-up balance  
6   that is rotatably mounted to the base, and a drive train that operatively connects the prime  
7   mover to the electrical generator.
